

Results of the IEER SME Outlook Survey

July 2015

Summary in English

Budapest, August 2015

The Institute for Economic and Enterprise Research operated by the Hungarian Chamber of Commerce and Industry (IEER or GVI in Hungarian) is a non-profit economic research institute indulging in applied research in several subfields of economics. Our mission is to provide empirically and theoretically substantiated knowledge and analysis of the economic and social processes that influence the actual situation and perspectives of Hungarian economy and Hungarian companies.

1. SME Outlook Business Climate Index and Uncertainty Index

The results of the latest IEER SME Outlook business climate survey reveal a less favourable economic condition compared to the previous quarter: the Business Climate Index decreased from 23 to 16 points. This value is the same that the one measured in January (16 points) and a bit lower than the one in July 2014 (18 points). The Uncertainty Index is at a current level of 35 points, which is lower than in the previous quarter (it was 38 points in April 2015), and is equal to the value measured in the preceding quarter. The value of the Uncertainty Index indicates that the current trend is not uniform within the private sector, and that it will continue to be confined to one part of the economy and will not be felt by all small and medium sized companies.

In sum, we can assess that according to the indicators the level of business climate is lower than in April 2015, but still higher than usual.

1.1. Quarterly developments in the SME Outlook Business Climate Index and in the SME Outlook Uncertainty Index

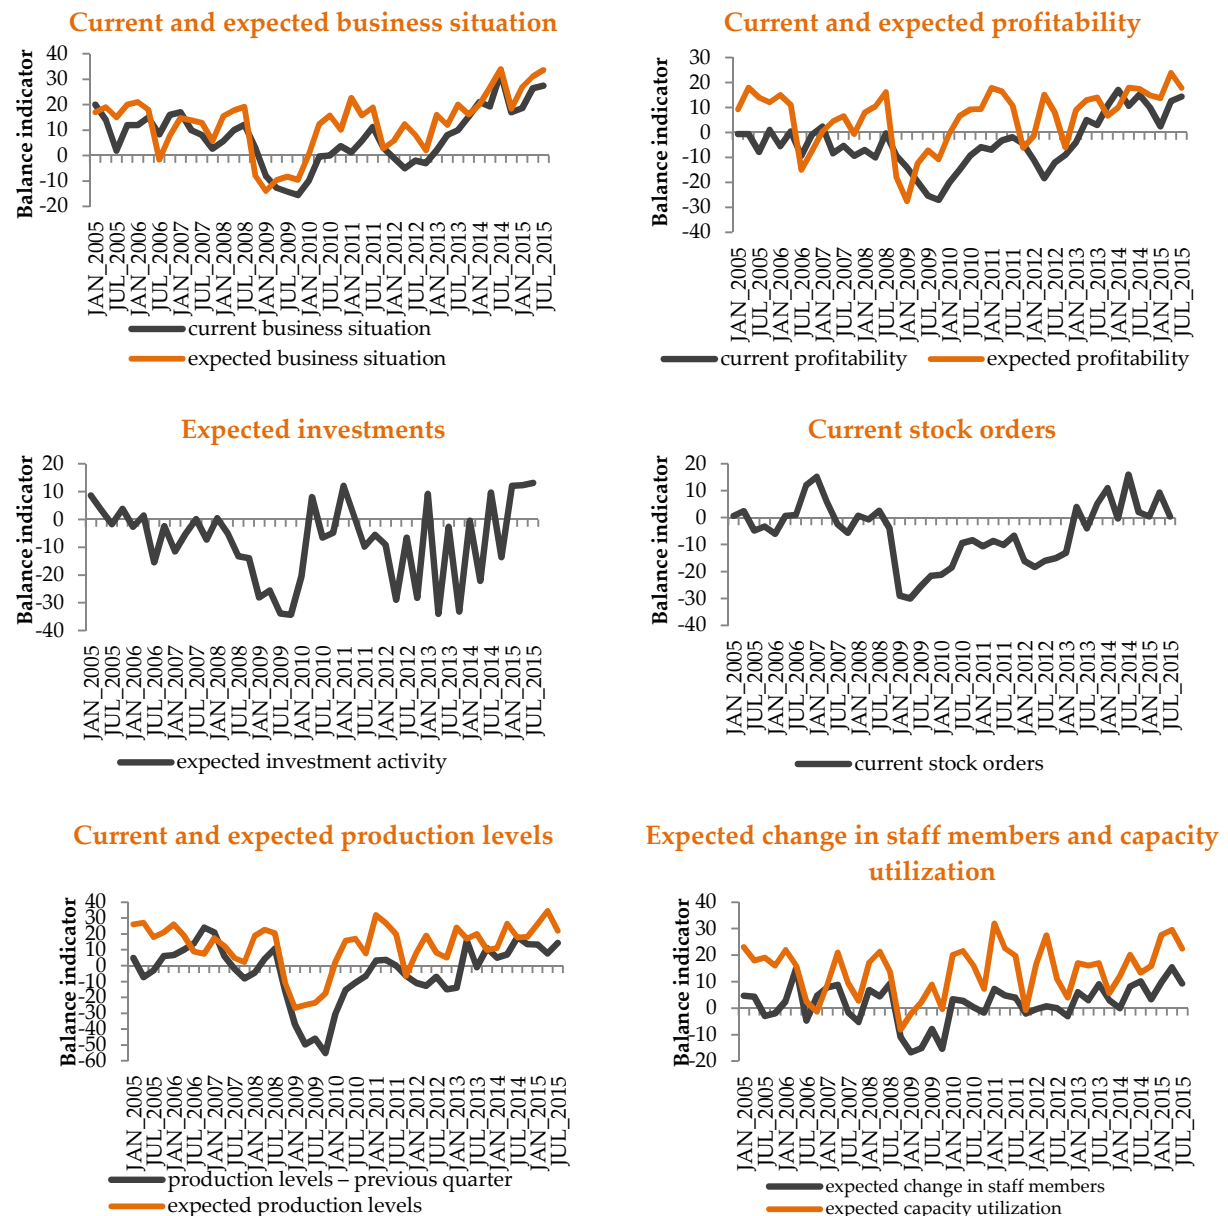

Source: IEER 2015

2. The components of the SME Outlook Business Climate Index

The SME Outlook Business Climate Index consists of ten components. The figures below demonstrate the quarterly developments of them.

2.1. Quarterly developments of the business climate indicators

Source: IEEER 2015

We can conclude that the decrease of the IEEER SME Outlook Business Climate Index is due to the decrease of half of the elementary indicators, and the less notable growth of the other half compared to the previous quarter. Typically, expectations of enterprises have decreased while their opinion on current situation has slightly improved. Among the five increasing elementary indicators the greatest increase has occurred in case of the production levels of the previous quarter (from 8 points to 14 points). The indicator of expected production levels decreased the most significantly (from 35 points to 22 points).

Annex

The formula of the SME Outlook Business Climate Index (BCI)

$BCI = 0.18 \cdot raj_ + 0.04 \cdot (uhj_ + vjj_ + tszm_ + lvv_ + uhv_) + 0.18 \cdot vjv_ + 0.10 \cdot cue_ + 0.18 \cdot tszv_ + 0.17 \cdot bv v_$ where:

- RAJ_: current stock orders
- UHJ_: current business situation
- VJJ_: current profitability
- TSZM_: production levels – previous quarter
- LVV_: expected change in staff members
- UHV_: expected business situation
- VJV_: expected profitability
- CUE_: expected capacity utilization
- TSZV_: expected production levels
- BVV_: expected investment activity

The formula for calculating the SME Outlook Business Climate Index was changed in January 2014, so the index follows the growth rates of GDP more precisely.

The formula of the SME Outlook Quarterly Uncertainty Index (UI)

UI = the variance of the BCI

The values of the indicators

The answers for the questions relating to the indicators worth the following scores:

Answer	Score
Good / Better / Growing / It will be better / It will grow	100
Satisfactory / Does not change / Will not change	0
Bad / Worse / Decreasing / It will be worse / It will decrease	-100
